DEPARTMENT OF COMMERCE BUREAU OF THE CENSUS WASHINGTON

FOURTEENTH CENSUS OF THE UNITED STATES MANUFACTURES: 1919

IDAHO

Prepared under the supervision of EUGENE F. HARTLEY, Chief Statistician for Manufactures

21-26677

EXPLANATION OF TERMS.

CONTENTS

		GENERAL	STATISTICS
eneral	eharacter	of the state	

Comparative summary
Statistics for the state, by counties
Principal industries, ranked by value of products
Persons engaged in manufacturing industries
Average number of wage earners for selected industries, with per eent, by sex and age
Average number of wage earners, by sex and age, and value of products, for cities of 10,000 inhabitants or more
Wage earners, by months
Wage earners, by months, for selected industries and for eities
Average number of wage earners, by prevailing hours of labor per week, for selected industries and for citics
Size of establishments, by average number of wage earners, for selected industries and for cities
Size of establishments, by value of products
Size of establishments, by value of products, for selected indus-
tries

ra	.ge
Size of establishments, by value of products, for eities of 10,000 inhabitants or more.	9
Character of ownership for scleeted industries and for cities	10

GENERAL TABLES	
Table 26Comparative summary for selected industries and eities:	
1919, 1914, and 1909.	13
Table 27.—Dctailed statement of all industries combined and for	

specified industries: 1919.

WASHINGTON GOVERNMENT PRINTING OFFICE 1921

4103

Scope of census.—Census statistics of manufactures are compiled primarily for the purpose of showing the absoluto and relative magnitude of the different branches of industry covered and their growth or decline. Incidentally, the effort is made to present data throwing light upon character of ownership, size of establishments, and similar subjects. When use is made of the statistics for these purposes it is imperative that due attention be given to their limitations, particularly in connection with any attempt to derive from them figures purporting to show aver-age wages, cost of production, or profits. The census did not cover establishments which were idle during the entire year or for which products were valued at less than \$500, or the manufacturing done in educational, eleemosynary, and penal institutions.

Period covered.—The returns relate to the calendar year 1919, or the business year which corresponded most nearly to that calendar year, and cover a year's operations, except for establishments which began or discontinued business during the YOUR.

The establishment.—As a rule, the term "establishment" represents a single plant or factory, but in some cases it represents two or more plants which were oper-ated under a commou ownership or fer which one set of books of account was kept. If, however, the plants constituting an establishment as thus defined were not all located within the same city, county, or state, separate reports were secured in order that the figures for each plant might be included in the statistics for the clty, county, or state in which it was located. In some instances separate reports were secured for different industries carried on in the same establishment.

Classification by industries.—The establishments were assigned to the several classes of industries according to their products of chief value. The products reported for a given industry may thus, on the one hand, include minor products different from those covered by the class designation, and, on the other hand, may not represent the total product covered by this designation, because some of this class of product may be made in establishments in which it is not the product of chief value.

As a rule, the same designation is used for the industry wherever it appears, although all of the products indicated by this designation were not manufactured in the state or clty for which these statistics are presented. In some instances the wording is changed so as to more correctly describe the products represented. For a number of industries subclasses are shown which indicate more definitely the kind of products.

Selected industries.—The general tables at the end of this bulletin give the prin-clpal facts separately for the industries of the state. A selection has been made of certain leading industries of the state for more detailed consideration. Sometimes an industry of great importance has to be omitted because it comprises so few estab-llshments that a detailed presentation would reveal the operations of individual concerns.

Comparisons with previous censuses .- Owing to changes in industrial conditions it is not always possible to classify establishments by industrias in such a way as to permit accurate comparison with preceding censuses. At the census of 1909 the figures for kindred industries were combined. This practice has been followed in compiling the statistics for 1919 and 1914 when placed in comparison with those for 1909 and prior years. The comparative summary for 1019, 1914, and 1909, there-fore, does not show separately all the industries given for 1919 in the detailed state-ment for the statistics. ment for the state

Influence of increased prices.—In comparing figures for cost of materials, value of products, and value added by manufacture in 1919 with the corresponding figures for carlier censuses, account should be taken of the general increase in the prices of commodities during recent years. To the extent to which this factor has been influential the figures fail to afford an exact measure of the increase in the volume of business. of business

¹ Persons engaged in the industry.—The following general classes of persons engaged in the manufacturing industries were distinguished: (1) Proprietors and firm members, (2) salaried officers of corporations, (3) superintendents and managers, (4) clorks (including other subordinate salariod employees), and (5) wage earners. In the reports for the censuses of 1904 and 1899 these five classes were shown according to the three main groups: (1) Proprietors and firm members, (2) salaried officials, clerks, etc., and (3) wage earners. In comparative tables covering the census of 1904 it is of oourse necessary to group the figures according to the classification that was employed at the earlier censuses. The number of persons ongaged in each industry, segregated by sex, and, in the case of wage earners, also by age (whether under 16 or 16 and over), was reported for a single representative day. The 15th of December was selected as representing for most industrios normal conditions of employment, but where this date was not a representative day an earlier date was chosen.

In the case of employees other than wage earners the number thus reported for the representative date has been treated as equivalent to the average for the year, since the number of employees of this class does not ordinarily vary much from month to month. In the case of wage earners the average has been obtained in the manner

the humber of employees of this class does not ordinary vary interivent north to month. In the case of wage earners the average has been obtained in the manner explained in the next paragraph. In addition to the more detailed report by sex and age of the number of wage earners on the representative date, a report was obtained of the number employed on the 15th of each month, by sex, without distinction of age. From these figures the average number of wage earners for the year has been calculated by dividing the sum of the numbers reported for the several months by 12. The importance of the industry as an employer of labor is believed to be more accurately measured by this average than by the number employed at any ono time or on a given day. The number of wage carners reported for the representative day, though given in certain tables for each separate industry, is not totaled for all industries combined for any state, because, in view of the variations of date, such a total is not believed to be significant. It would involve more or less duplication of persons working in different industries at different times, would not represent the total number em-ployed in all industries at any one time, and would give an undue weight to seasonal industries as compared with industries in continual operation. This total, however, is shown for the different cities, because the limited area and greater regularity of employment largely overcame the objection incident to its publication for the sepa-rate states or the United States.

(2)

In order to determine as nearly as possible the age distribution of the average number of wage earners for a given state as a whole, the per cent distribution by age of the wage earners in each industry for December 15, or the nearest representa-tive day, has been calculated from the actual numbers reported for that date. The percentages thus obtained have been applied to the average number of wage earners for the year in that industry to determine the average numbers 16 years and over, and under 16, employed. These calculated averages for the several industries have been added to give the average distribution for each state as a whole and for the entire country.

Salarles and wages.—Under these heads are given the total payments during the year for salaries and wages, respectively. The Census Bureau has not undertaken to calculate the average annual earnings of either salaried employces or wage carners. Such averages would possess little real value, because they would be based on the earnings of employees of both sexes, of all ages, and of widely varying degrees of skill. Furthermore, so far as wage earners are concerned, it would be impossible to calcu-late accurately even so simple an average as this, since the number of wage earners fluctuates from month to month in every industry, and in some cases to a very great extent. The Census Bureau's figures for wage earners, as already explained, are averages based on the number employed on the 15th of each month, and while representing the number according to the pay rolls to whom wages were paid on that date, no doubt represent a larger number than would be required to perform the work in any industry if all were continuously employed during the year.

Prevailing hours of labor.—No attempt was made to ascertain the number of wage earners working a given number of hours per week. The inquiry called merely for the prevailing practice followed in each establishment. Occasional variatious in hours in an establishment from one part of the year to another were disregarded, and no attention was paid to the fact that a few wage earners might have hours differing from those of the majority. All the wage earners of each establishment it is if alls. In most establishments, however, practically all the wage earners work the sama number of hours, so that the figures give a substantially correct representation of the hours of labor.

Capital.-The instructions on the schedule for securing data relating to capital were as follows

" "The answer should show the total amount of capital, both owned and borrowed, on the last day of the business year reported. All the items of fixed and live capital may be taken at the amounts carried on the books. If laud or buildings are rented, that fact should be stated and no value given. If a part of the land or buildings is owned, the remainder being rented, that fact should be so stated and only the value of the owned property given. Do not include securities and loans representing investments in other enterprises."

These instructions were identical with those employed at the censuses of 1914 and 1909. The data compiled in respect to capital, however, at both censuses, as well as at all precoding censuses of manufactures, have been so defective as to be of little value except as indicating very general conditions. In fact, it has been repeatedly recommended by the census authorities that this inquiry be omitted from the schedule. While there are some establishments whose accounting sys-tems are such that an accurate return for capital could be made, this is not true of the great majority, and the figures therefore do not show the actual amount of capital invested. capital invested.

Materials.—The statistics as to cost of materials relate to the materials used during the year, which may be more or less than the materials purchased during the year. The term "materials" covers fuel, rent of power and heat, mill supplies, and containers, as well as materials which form a constituent part of the product.,

Rent and taxes.—The taxes include certain Federal taxes and state, county, and local taxes. Under "Federal taxes" there are included the internal revenue tax on manufactures (tobacco, beverages, etc.), excise taxes when included in values reported for products, corporation capital stock tax, and corporation income tax, but not the income tax for individuals and partners.

Value of products.-The amounts given under this heading represent the selling value or price at the factory of all products manufactured during the year, which may differ from the value of the products sold.

May differ from the value of the products sold. Value added by manufacture.—The value of products is not always a satis-factory measure of either the absolute or the relative importance of a given industry, because only a part of this value is actually created by the manufacturing processes carried on in the industry itself. Another part, and often by far the larger one, represents the value of the materials used. For many purposes, therefore, the best measure of the importance of an industry, from a manufacturing standpoint, is the value created by the manufacturing operations carried on within the indus-try. This value is calculated by deducting the cost of the materials used from the value of the products. The figure thus obtained is termed in the census reports "value added by manufacture."

Cost of manufacture and profits.—The census data do not show the entire cost of manufacture, and consequently can not be used for the calculation of profits. No account has been taken of depreciation or interest, rent of offices and buildings other than factory or works, insurance, ordinary repairs, advertising, and other sundry expenses.

Primary horsepower.—This item represents the total primary power generated by the manufacturing establishments plus the amount of power, principally elec-tric, rented from other concerns. It does not cover the power of electric motors taking their current from dynamos driven by primary power machines operated by the same establishment, because the inclusion of such power would obviously result in duplication. The figures for primary horsepower represent the rated capacity of the engines, motors, etc., and not the amount of power in actual daily use USe.

Fuel.—Statistics of the quantity of fuel used are shown only for anthracite and bituminous coal, coke, fuel oils, gasoline and other volatile oils, and gas—natural and manufactured, and represent the quantity used during the year. As only the principal kinds of fuel are shown, comparison as to the total cost of all fuelis im-practicable. A comparison, however, of the total quantities of the several kinds of fuel used in 1919 and 1914 is given.

LIBRARY OF CONGRESS RECEIVED AUG121921 DOCUMENTS DIVISION

IDAHO.

GENERAL STATISTICS.

General character of the state.—Idaho has a gross area of 83,888 square miles, of which 83,354 represent land surface. The inhabitants of the state in 1900 numbered 161,772; in 1910, 325,594; and in 1920, 431,866. In total population Idaho ranked fortysecond among the states in 1920 and in density of population forty-third. The number of inhabitants per square mile in 1910 was 3.9, the corresponding figures for 1920 being 5.2.

HIGTRT

. Iz A4

color

15

1919

3.0

There were in the state in 1920 only two cities having more than 10,000 inhabitants—Boise and Pocatello. These cities, with a combined population of 36,394, formed 8.4 per cent of the total population for Idaho in that year and reported 11.4 per cent of the value of the state's manufactured products in 1919.

Importance and growth of manufactures (Table 1).— The increases in wages, cost of materials, and the value of products, as presented in this table, were chiefly due to the change in industrial conditions brought about by the World War, and therefore can not be used to measure the growth of manufactures between the industrial censuses 1914 and 1919. However, a comparison of the number of persons engaged and the horsepower used in 1919 and 1914 shows a large increase in the manufacturing activities of the state. The addition of the Federal income tax since 1914 will account for the exceptional increase in "Rent and taxes."

Statistics for the state, by counties (Table 2). Figures are not available for comparison of county totals for 1919 with those for prior censuses.

Principal industries, ranked by value of products (Table 3).—The ranking of industries by value of products is often misleading as to their real importance from a manufacturing standpoint. The ranking of many industries would change materially if based upon the average number of wage earners or value added by manufacture.

Persons engaged in manufacturing industries (Table 4).—The age classification of the average number of wage earners in this and other tables is an estimate obtained by the method described in the "Explanation of terms." The classification by sex for 1919 was reported separately, but for 1914 and 1909 was obtained in the same manner as the distribution by age. Figures for individual industries will be found in Table 27.

Average number of wage earners for selected industries (Table 5).—The industries covered by this table are those which employed 100 or more wage earners in 1919, and for which statistics can be shown, without the possibility of disclosing the operations of individual establishments.

Average number of wage earners, by sex and age, and value of products for cities of 10,000 inhabitants or more (Table 6).—This table shows that 17 per cent of the wage earners 16 years of age and over reported for Boise in 1919 were females, the corresponding proportion for Pocatello being 5.1 per cent. A comparison of the figures with those presented in Table 5 shows a larger percentage of females was employed in the cities than in the state.

Wage earners, by months (Table 7).—The statistics for wage earners in this table are intended to show the steadiness of employment, or the reverse, in accordance with the industrial conditions existing during the several census years.

Wage earners, by months, for selected industries and for cities (Table 8).—In addition to the number of wage earners employed by months, similar data are given for males and females for all industries combined and for the two cities. Except in the manufacture of confectionery and ice cream, there was no important industry in the state in which the number of female wage earners predominated.

Prevailing hours of labor (Table 9).—The figures presented in this table show a decided shortening of the hours of labor since the census of 1914. In that year 6.6 per cent of the wage earners were included in the group ''48 and under,'' as against 81.5 per cent in 1919. On the other hand, in 1914 the ''60'' and ''over 60'' groups constituted 75 per cent of the total wage earners, as compared with 8.4 per cent in 1919.

Size of establishments, by average number of wage earners, for selected industries (Table 10).—The predominance of the number of small establishments, when based on the number of wage earners employed, is evidenced in this table by the fact that of the total number of establishments in the state, 77.7 per cent were in the classes having less than six wage earners, while such establishments employed but 7.9 per cent of the total number of wage earners. On the other hand, the number of establishments having more than 100 wage earners formed only 3.3 per cent of the total number of establishments, but reported 69 per cent of the average number of wage earners in the state.

Size of establishments by value of products (Table 11).—At the censuses of 1909 and 1914 establishments with products valued at \$100,000 to \$1,000,000 constituted one group, but at the census of 1919 this group was subdivided into "\$100,000 to \$500,000" and "\$500,000 to \$1,000,000." Separate figures for the number of establishments and value of products have been compiled, however, from the returns for 1914. The table, therefore, gives combined figures for these

· :

(3)

50764-21

two groups for 1909, and for the average number of wage earners and value added by manufacture in 1914.

Size of establishments, by value of products, for selected industries (Table 12).—In the preparation of this table it was necessary in several instances for 1914 to combine the establishments of one group with those of another group, to avoid the possibility of disclosing the operations of individual establishments.

Size of establishments, by value of products, for Boise and Pocatello (Table 13).—This table strikingly illustrates the fact that the number of establishments of itself is no real index of manufacturing activities.

Character of ownership (Table 14).—The tendency of manufactures toward the corporate form of ownership since the 1909 census is presented in this table. In 1919 "corporations" reported 30.8 per cent of the total number of establishments in the state, while the corresponding proportion for 1914 was 26.8 per cent. There was an increase of 4,846, or 67 per cent, in the average number of wage earners under corporate ownership, and \$47,530,183, or 209.4 per cent, in the value of products during the census period 1914–1919. Manufactures, by population groups, in cities of 10,000 inhabitants or more (Table 15).—This table shows that relatively the manufactures in Boise and Pocatello were not of great importance as to value of products, the two cities combined reporting but 11.4 per cent of the total for the state both in 1919 and 1914. The proportion of wage earners for the two cities, however, was greater in 1919, being 15.9 per cent, as against 12.7 per cent in 1914.

Number and horsepower of types of prime movers (Table 16).—Although there was an actual increase in both the owned and rented power from census to census, the percentage of increase in rented power was greater, being 83.2 per cent, as compared with 37.8 per cent for owned power for the five-year period 1914-1919.

Fuel consumed (Table 17).—This table shows the principal kinds of fuel used by the manufacturing plants in the state in 1919 and 1914 and gives separately for 1919 the amounts consumed by a number of important industries which use considerable quantities of fuel.

¹Among the industries for which statistics can not be shown separately without the possibility of disclosing individual operations are a number having products in excess of some for which figures are shown in the table. Of these industries the most important are the following: Condensed milk; smelting, lead; and sugar, beet.

SPECIAL STATISTICS.

For a number of important industries the Census Bureau collects, by means of special schedules, certain details which do not appear on the general schedule. Data for four of these industries in Idaho are presented.

Lumber and timber products (Table 18).—Thelumber industry is of first importance in Idaho, the value of lumber and timber products forming 37.4 per cent of the total value of all manufactured products for the state in 1919. The following table shows the production of lumber for 1919, 1914, and 1909, and lath and shingles for 1919 and 1909:

TABLE 18.—PRODUCTION OF LUMBER, LATH, AND SHINGLES: 1919, 1914, AND 1909.

		QUANTITY.			
PRODUCT.	1919	1914	1909		
Lumber	765, 388 69, 150 22, 657	¹ 763, 508 (²) (³)	645, 800 86, 740 62, 308		

The relative importance of Idaho as a lumberproducing state is increasing. In 1919 it ranked sixteenth among the states in the production of this commodity, in 1914 twentieth, and in 1909 twenty-fifth.

In 1919, 33.4 per cent of the total lumber cut was from western yellow pine, 30.6 per cent from Idaho white pine, and 18.7 per cent from larch. Other important woods cut were white fir, Douglas fir, cedar, and spruce.

Flour-mill and gristmill products (Table 19).— Wheat flour is still the leading product, forming 82 per cent of the total value of products for the industry in 1919, as compared with 66.6 per cent in 1914. During this five-year period there was an increase in wheat flour of 531,563 barrels, or 92.9 per cent, in quantity, and \$8,815,774, or 389.8 per cent, in value. Bran and middlings during this period increased 14,118 tons, or 54.7 per cent, in quantity, and \$995,438, or 195.4 per cent, in value.

TABLE 19.—FLOUR-MILL AND GRISTMILL PRODUCTS (MERCHANT
MILLS): 1919, 1914, AND 1909.

Butter, cheese, and condensed milk (Table 20).— This table shows the quantity and value of the several products of the industry for 1919, 1914, and 1909.

Butter continues to be the product of chief value and at an increased proportion, forming 69.9 per cent of the total value of all products of the industry in the state in 1919, as compared with 58.2 per cent in 1914. During this five-year period cheese increased 249.4 per cent in quantity and 636 per cent in value.

¹ Excludes statistics for 2 establishments manufacturing condensed milk in 1919 to avoid disclosure of individual operations.
 ² Included in "All other products" to avoid disclosure of individual operations.

Printing and publishing (Table 21).—The table which follows gives the number of publications and aggregate circulation per issue for all newspapers and periodicals published in Idaho during 1919, 1914, and 1909.

Of the daily papers, 5, with a circulation of 27,452, were published in the morning and 12, with a circulation of 36,446, in the afternoon. Although there was a decrease in the total number of publications during the five-year period from 1914 to 1919, the total circulation increased 11.5 per cent. All the publications were printed in the English language. TABLE 21.—PRINTING AND PUBLISHING: 1919, 1914, AND 1909.

Dyeing and cleaning. (Table 23).—Statistics for dyeing and cleaning establishments that were operated by mechanical power in 1919 are presented in this table. Statistics for such establishments are not included in the general tables nor in the totals for manufacturing industries for censuses since 1900. This presentation is the first of its kind that has been made since the census statistics were confined to manufacturing industries as distinguished from the hand trades, household industries, etc.

Custom sawmills and gristmills (Tables 24 and 25).--Statistics for custom sawmills and custom gristmills are not included in the general tables nor in the totals for manufacturing industries. Data for these custom mills were not collected in 1914. Tables 24 and 25, however, summarize the statistics for such mills for 1919 and 1909.

GENERAL TABLES.

Table 26 gives the number of establishments, average number of wage earners, primary horsepower, wages, cost of materials, and value of products for all industries combined and for selected industries in the state, 1919, 1914, and 1909, and similar data for all industries combined for Boise and Pocatello. Certain kindred industries are combined in some instances for comparison with 1909.

The value of products for custom sawmills represents the amount charged for the work performed and that for custom gristmills the selling value of the grain milled.

TABLE 25.—CUSTOM GRISTMILLS: 1919 AND 1909.
